## Key Questions & Answers:

1. **Is the form submitted using POST?**
   **Answer:** Yes. The contact and feedback forms use method="POST" so that user data is sent securely in the HTTP request body and is not exposed in the browser URL.

2. **Are inputs validated and sanitized server side?**
   **Answer:** Yes. Inputs are trimmed, sanitized using htmlspecialchars() to prevent Cross-Site Scripting (XSS), and emails are validated using filter_var($email, FILTER_VALIDATE_EMAIL).

3. **Is file writing handled safely?**
   **Answer:** Yes. For CSV files, safe file pointers with fopen() in append mode ('a') and fputcsv() are used. For JSON storage, file_put_contents() with json_encode() is implemented.

4. **Are success and error responses displayed clearly?**
   **Answer:** Yes. Conditional alert banners (alert-success and alert-danger) are displayed at the top of the webpage informing the user whether the record was stored successfully or highlighting validation issues.

## Key Questions & Answers:

1. **Is the schema normalized properly?**
   **Answer:** Yes. The schema is organized into separate normalized tables (users, students, events, registrations, audit_logs) to eliminate data redundancy and maintain referential integrity.

2. **Are primary keys and foreign keys correctly defined?**
   **Answer:** Yes. Each table defines an auto-incrementing integer PRIMARY KEY (id), and unique constraints are enforced on student_id, username, and email.

3. **Is the database connection handled securely?**
   **Answer:** Yes. The connection uses error handling with connect_error and PDOException try-catch blocks, sets the character encoding to utf8mb4, and supports prepared statements.

| DIVISION-2 (3CE) | BATCH: (C2) | ID NO: 25CE140 |
|---|---|---|

**PRACTICAL: 9** | **Aim:** To implement secure user registration by inserting user details into MySQL using MySQLi, validate inputs on frontend and backend, check for duplicate email/username, and hash passwords using password_hash().

**Output:**

**Output Result:**
[Real-time frontend regex validation with interactive password strength meter]

Github-link: https://github.com/voramonali9-alt/wdf3rd

## Key Questions & Answers:

1. **Is password_hash() used before storing passwords?**
   **Answer:** Yes. Passwords are never stored in plain text. PHP's password_hash($password, PASSWORD_DEFAULT) is used to generate a secure bcrypt hash before inserting into the users table.

2. **Is duplicate email/username checked?**
   **Answer:** Yes. A MySQLi prepared statement queries SELECT id FROM users WHERE username = ? OR email = ? before executing the insert. If a match is found, registration is blocked with a friendly warning.

3. **Are frontend and backend validations consistent?**
   **Answer:** Yes. Both client-side JavaScript (register.js) and server-side PHP (register.php) check for minimum name length, email format, 10-digit mobile number, password length, and matching confirm-password.

| DIVISION-2 (3CE) | BATCH: (C2) | ID NO: 25CE140 |
|---|---|---|

**PRACTICAL: 10** | **Aim:** To develop secure login and logout functionality using PHP sessions, password verification using password_verify(), session ID regeneration, role-based access control, session timeout, and remember-me tokens.

**Output:**

**Output Result:**
[Protected student dashboard showing attendance, enrolled course, and event registrations]

Github-link: https://github.com/voramonali9-alt/wdf3rd

## Key Questions & Answers:

### 1. Are sessions started and destroyed securely?

**Answer:** Yes. Sessions are started with session_start(), session IDs are regenerated using session_regenerate_id(true) on login to prevent session fixation, and destroyed on logout with session_destroy() and cookie cleanup.

2. **Is password_verify() used correctly?**
   **Answer:** Yes. password_verify($password, $user['password']) securely verifies the user-entered plaintext password against the database bcrypt hash.

3. **Is unauthorized dashboard access blocked?**
   **Answer:** Yes. The check_auth() function checks if $_SESSION['user_id'] exists; unauthenticated requests are immediately redirected to login.php?error=unauthorized.

4. **Is session timeout implemented?**
   **Answer:** Yes. Inactivity exceeding 900 seconds (15 minutes) compares time() - $_SESSION['last_activity'] and automatically destroys the session, redirecting to login.php?error=timeout.

5. **Are admin and student users redirected to appropriate dashboards?**
   **Answer:** Yes. Role-Based Access Control checks $_SESSION['role']: admin users redirect to admin_dashboard.php while student users redirect to dashboard.php.

**Output:**

**Output Result:**
[Complete student management interface with search, filter, edit, delete confirmation, and CSV download]

Github-link: https://github.com/voramonali9-alt/wdf3rd

## Key Questions & Answers:

1. **Are SELECT, INSERT, UPDATE, and DELETE operations working?**
   **Answer:** Yes. Full CRUD is implemented using MySQLi prepared statements for adding students, viewing records in a data table, editing existing records, and removing records.

2. **Is search by name/email/course implemented?**
   **Answer:** Yes. Dynamic SQL query building with LIKE ? operators allows searching across student name, email, student ID, and department simultaneously.

3. **Are delete operations confirmed before execution?**
   **Answer:** Yes. The JavaScript confirm() dialog ("Are you sure you want to delete this student?") prevents accidental record deletions.

| DIVISION-2 (3CE) | BATCH: (C2) | ID NO: 25CE140 |
|---|---|---|

**PRACTICAL: 12** | **Aim:** To develop event management CRUD functionality for admin users to add, view, update, delete, and upload event posters with server-side file type and file size validation.

```

**Output:**

**Output Result:**
[Event management CRUD interface displaying posters, status, and handling multipart image uploads]

Github-link: https://github.com/voramonali9-alt/wdf3rd

## Key Questions & Answers:

1. **Are add, update, and delete functionalities implemented correctly?**
   **Answer:** Yes. Admins can create new events, modify details and posters, and delete events using prepared MySQLi queries.

2. **Is the UI linked with the database correctly?**
   **Answer:** Yes. Events stored in the MySQL events table are retrieved and rendered with thumbnails, dates, venues, categories, and status indicators.

3. **Are poster uploads validated for type and size?**
   **Answer:** Yes. Uploaded files via $_FILES['poster'] are validated for allowed extensions (jpg, jpeg, png, webp, gif) and capped at 2MB maximum file size.

4. **Are success and failure messages displayed?**
   **Answer:** Yes. User-friendly alert boxes notify the administrator about upload outcomes, validation errors, and database updates.

| DIVISION-2 (3CE) | BATCH: (C2) | ID NO: 25CE140 |
|---|---|---|

**PRACTICAL: 13** | **Aim:** To create simple PHP JSON API endpoints for events and consume them using the JavaScript Fetch API to perform list, add, update, and delete operations asynchronously without full page reload.

## Page: 1_events_api.php

**Code:**

**Output:**

**Output Result:**
[Fetch API implementation managing asynchronous requests, DOM row insertion, deletion, and status alerts]

Github-link: https://github.com/voramonali9-alt/wdf3rd

## Key Questions & Answers:

**1. Do PHP endpoints return valid JSON responses?**

**Answer:** Yes. The endpoint sets header('Content-Type: application/json; charset=UTF-8') and serializes data using json_encode().

2. **Are GET and POST requests handled properly?**
   **Answer:** Yes. GET fetches the event list, while POST handles JSON action dispatches for 'add' and 'delete' operations.

3. **Are loading, success, and error states shown on the frontend?**
   **Answer:** Yes. A loading indicator displays during network fetching, while success/error toasts inform the user after API execution.

4. **Is input validation performed before database operations?**
   **Answer:** Yes. Required fields (title, venue, description) are validated server-side before executing prepared statements.

**Output:**

**Output Result:**
[Role-based dynamic navigation bar showing distinct menu items for Guests, Students, and Admins]

Github-link: https://github.com/voramonali9-alt/wdf3rd

## Key Questions & Answers:

1. **Are dashboard values loaded dynamically from the database?**
   **Answer:** Yes. Metric cards compute live totals directly from MySQL using SELECT COUNT(*) on the students, events, users, and registrations tables.

2. **Is access restricted to admin users?**
   **Answer:** Yes. check_auth('admin') blocks unauthorized users and students, redirecting them to their respective areas.

3. **Are role-based menus working?**
   **Answer:** Yes. The header evaluates the active session role: Admins see management tools, Students see academic links, and Guests see public options.

4. **Are important admin actions recorded in audit_logs?**
   **Answer:** Yes. Critical operations (user logins, logouts, adding/deleting students and events) insert records into the audit_logs table with timestamps.
